

Fact Sheet: EcoAqua™

EcoAqua is a blend of selected strains of *Bacillus subtilis*, *B. laterosporus*, *B. licheniformis*, *B. megaterium*, essential nutrients, amino acid and vitamins.

EcoAqua promotes the development of vertebrate and invertebrate larvae and juveniles fed live or artificial food by:

- Breaking down particulate organic matter
- Absorbing dissolved organic matter
- Reducing the concentration of ammonia without accumulation of nitrites or nitrates
- Reducing populations of deleterious bacteria by nutrient competition and by production of active metabolites that inhibit the proliferation of several strains of Vibrios and Pseudomonads

EcoAqua is a liquid product that readily dissolves in water. EcoAqua is added directly to the water in the culture system. The dose of EcoAqua added is between 0.4 to 4 ml per gallon (0.1 to 1 ml per liter). Frequency of application depends on the density of animals in the culture system.
